## 4 Blade Folding Propeller

**Tristream Propeller Company manufactures precision machined stainless steel 4-blade folding propellers. Because of the simplicity of design, infinite variations are possible for all sailing vessels.**

**Offering the efficiency of a fixed blade propeller in forward and reverse, the superior design and performance provides the added advantage of minimal drag when under sail, also working well as a brake.**

**Each propeller is geared so that each blade moves simultaneously. The titanium components ensure resistance to crevice corrosion leading to minimal maintenance. Currently used on commercial and private vessels all over the world, the 4-blade propeller offers performance, value and reliability.**

## **3 Blade Folding Propeller**

**Problems with inefficiency, braking, poor reversibility, vibration, electrolysis and corrosion have long been the curse of the yachting community. Tristream Propellers now overcomes this with the precision machined stainless steel 3-blade folding propeller.**

**Designed with both the social cruiser and racer market in mind, the 3-blade folding propeller's centrifugal force opens the spinning prop with each blade constructed with the majority of weight on the outer edges. The propeller closes when the engine is idle due to the force of water providing minimal drag.**

**3 blade folding propellers are used domestically and internationally on catamarans and single hull vessels and are also available in a sail drive format.**
